

How to Guide

Twitter Scraper (DP)

Version: R-4.5

Contents

1. Component Overview	3
2. Step by Step Process to Use Twitter Scrapper	3

1. Component Overview

Twitter Scrapper helps in scrapping Twitter data. Twitter Scrapper provides two types of scrapping:

1. Real-Time
2. History Data

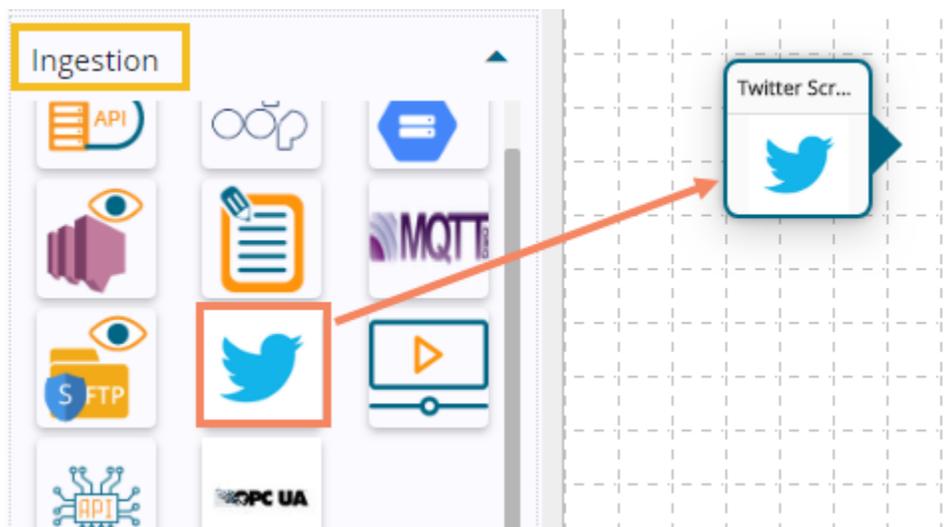

Real-Time – By using this option, the user can fetch the live Tweets by using twitter API along with specific search filters.

History Data – By using this option, the user can provide or fetch twitter data of past 7 days (provided limit is up to 1000 tweets). It also provides us a facility to fetch data according to specific tags.

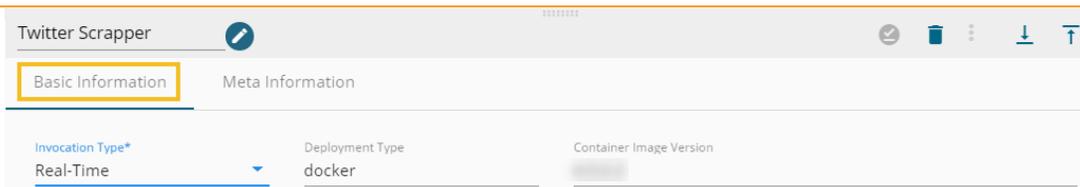

2. Step by Step Process to Use Twitter Scrapper

The steps to configure the Twitter Scrapper component is described in this section.

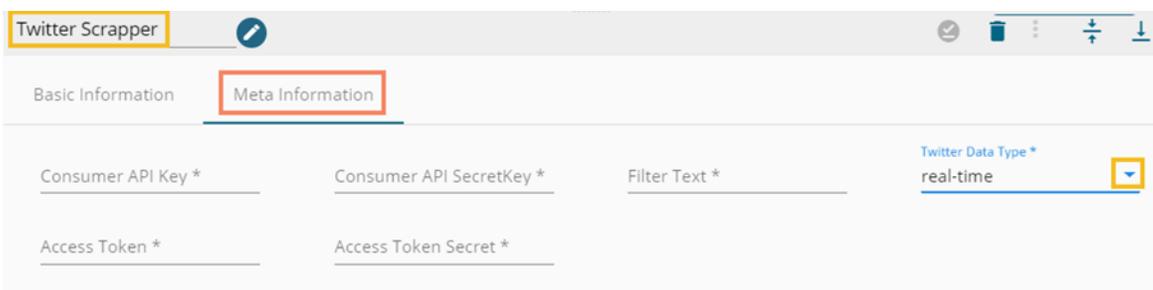

- i) Navigate to the Pipeline Editor.
- ii) Drag the Twitter Scrapper from the Ingestion section provided under the Components Pallet and drop to the Pipeline Workspace.

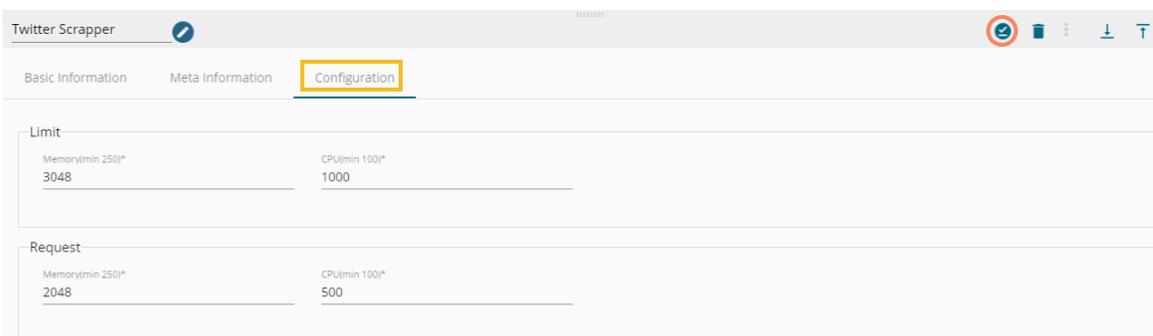

- iii) Click the dragged Twitter Scrapper component to get the Configuration fields:
- iv) The Basic Information tab opens by default.
 - a. Select the invocation type (at present only '**Real-Time**' option is provided)
 - b. Deployment Type: It comes preselected based on the component.
 - c. Container Image Version: It comes preselected based on the component.

- v) Click on the Meta Information tab to open the configuration fields for the selected columns.
 - a. Consumer API Key: This is always is going to be unique depending upon user’s account. It is essential in both the cases of scrapping Real-time and History Data.
 - b. Consumer API Secret Key: This is always is going to be unique depending upon user’s account. It is essential in both the cases of scrapping Real-time and History Data.
 - c. Filter Text: This field is used to specify separate tags which user wants to fetch from a twitter. It provides the choice to the user for fetching multiple tags data at a time, to accomplish this user need to provide tags name with a comma separator. For instance, #India, #Cricket
 - d. Twitter Data Type: This field provides dropdown menu from where the consumer can select the scrapping strategy(real-time/history).
 - e. Access Token: This field is consumable only when user wants to fetch real-time data from a scrapper.
 - f. Access Token Secret: This field is consumable only when user wants to fetch real-time data from a scrapper.

- vi) Click on the Configuration tab to configure the required information.
 - a. Limit: Provide Memory and CPU details to configure the limit
 - b. Request: Provide Memory and CPU details to configure the request
 - c. Click the ‘Save’  icon.

Note: The user should know Consumer API Key, Consumer Secret Key, Access Token, Access Token Secret from a developer account of twitter.
